MAIN FEATURES

- Note: From October 1982 the population survey used a new sample which was selected on the basis of data obtained from the 1981 Census of Population and Housing. For a brief description of the effects of the new sample see paragraphs 21-3 of the Explanatory Notes on page 3.
- Compared with November 1981, the number of persons employed on a full-time basis in November 1982 had fallen by 13,600 to 445,200, while the number employed in part-time jobs had risen by 10,000 to 115,200, resulting in a net drop of 3,500 in persons employed.
- The estimated number of unemployed persons increased by 7,900 to 53,700 over the same year, resulting in an unemployment rate of 8.7 per cent for November 1982. For males the increase was 6,300, including an increase of 3,700 for males born outside Australia. The unemployment rate for persons born outside Australia jumped from 8.6 per cent in November 1981 to 11.9 per cent in November 1982.

EXPLANATORY NOTES

INTRODUCTION

This bulletin contains estimates of the civilian labour force derived from the labour force survey part of the population survey, which is now conducted monthly. Until February 1978, surveys were conducted in February, May, August and November each year.

2. Although emphasis in the labour force survey is placed on the regular collection of data on demographic and labour force characteristics of the population, supplementary and special surveys of particular aspects of the labour force or of other subjects are carried out from time to time. Statistics from these surveys are published and are available on request. A list of publications on labour force and related topics is given in The Labour Force, Australia (6203.0).

THE POPULATION SURVEY

3. The population survey is based on a multi-stage area sample of private dwellings (about 5,000 houses, flats, etc.) and non-private dwellings (hotels, motels, etc.), and covers about one per cent of the population of South Australia. The information is obtained from the occupants of selected dwellings by carefully chosen and specially trained interviewers. The interviews are

generally conducted during the two weeks beginning on the Monday between the 6th and 12th of each month. The information obtained relates to the week before the interview (i.e. the survey week). Because of operational problems arising from the Christmas and New Year holidays the December 1978 and 1979 surveys commenced a week earlier than usual (with most interviews being conducted during the second week) and the January 1979 and 1980 surveys commenced a week later than usual.

SCOPE AND COVERAGE

4. The labour force survey includes all persons aged 15 and over except:

- (a) members of the permanent defence forces;
- (b) certain diplomatic personnel of overseas governments, customarily excluded from census and estimated populations;
- (c) overseas visitors holidaying in Australia; and
- (d) members of non-Australian defence forces (and their dependants) stationed in Australia.

DEFINITIONS

5. The labour force category to which a person is assigned depends on his actual activity (i.e. whether working, looking for work, etc.) during the survey week. The following definitions, which conform closely to the international standard definitions specified by the International Labour Organisation (ILO), relate only to those persons within the scope of the survey.

6. Employed persons comprise all those aged 15 and over who, during the survey week:

- (a) worked for one hour or more for pay, profit, commission or payment in kind in a job or business, or on a farm (including employees, employers and self-employed persons); or
- (b) worked for 15 hours or more without pay in a family business or on a farm (i.e. unpaid family helpers); or
- (c) were employees who had a job but were not at work and were: on paid leave; on leave without pay for less than four weeks up to the end of the survey week; stood down without pay because of bad weather or plant breakdown at their place of employment for less than four weeks up to the

end of the survey week; on strike or locked out; on workers' compensation and expected to be returning to their job; or receiving wages or salary while undertaking full-time study; or

- (d) were employers or self-employed persons who had a job, business or farm, but were not at work.

7. Unemployed persons are those aged 15 and over who were not employed during the survey week, and

- (a) had actively looked for full-time or part-time work at any time in the four weeks up to the end of the survey week and:

- (i) were available for work in the survey week, or would have been available except for temporary illness (i.e. lasting for less than four weeks to the end of the survey week); or

- (ii) were waiting to start a new job within four weeks from the end of the survey week and would have started in the survey week if the job had been available then;

or (b) were waiting to be called back to a full-time or part-time job from which they had been stood down without pay for less than four weeks up to the end of the survey week (including the whole of the survey week) for reasons other than bad weather or plant breakdown.

8. Actively looking for work includes writing, telephoning or applying in person to an employer for work; answering a newspaper advertisement for a job; checking factory or Commonwealth Employment Service noticeboards; being registered with the Commonwealth Employment Service; checking or registering with any other employment agency, advertising or tendering for work; and contacting friends or relatives. In November 1981 a number of minor amendments were made to the labour force survey questionnaire. (For details see the Information Paper: Questionnaires used in the Labour Force Survey, December 1981 (6232.0). The amendments included a re-ordering and some re-wording of the categories of steps taken to find work.

9. The unemployment rate for any group is the number unemployed expressed as a percentage of the labour force (i.e. employed plus unemployed) in the same group.

10. Duration of unemployment is the period from the time the person began looking for work or was

laid off to the end of the survey week. Periods of unemployment are recorded in complete weeks and this results in a slight understatement of duration. Average (mean) duration is the duration obtained by dividing the aggregate number of weeks a group has been unemployed by the number of persons in that group.

11. The labour force comprises all persons who, during the survey week, were employed or unemployed, as defined in paragraphs 6 and 7.

12. The labour force participation rate for any group is the labour force expressed as a percentage of the civilian population aged 15 and over in the same group. Because it is not practicable to ascertain the birthplace of persons in institutions (who are classified as not in the labour force), labour force participation rates for persons classified by birthplace are calculated by using population estimates which exclude those in institutions.

13. Full-time workers are those who usually work 35 hours or more a week and others who, although usually part-time workers, worked 35 hours or more during the survey week. Part-time workers are those who usually work less than 35 hours a week and who did so during the survey week. When recording hours of work, fractions of an hour are disregarded.

14. Hours of work. The figures of aggregate hours and of average hours refer to actual hours worked during the survey week, not hours paid for. The figures may be affected by public holidays, leave, absenteeism; temporary absence from work due to sickness, injury, accident and industrial disputes; and stoppages of work due to bad weather, plant breakdown, etc. When hours of work are recorded, fractions of an hour are disregarded and this results in slightly lower figures than would be the case if actual time worked was recorded. Persons stood down for the whole of the survey week without pay because of bad weather or plant breakdown at their place of employment are regarded as employed and therefore are included (working no hours) in the calculation of average hours worked. Persons stood down in the survey week for reasons other than bad weather and plant breakdown and waiting to be called back to their job are regarded as unemployed and are therefore excluded from the calculation.

15. Persons not in the labour force are those who, during the survey week, were not in the categories employed or unemployed, as defined in paragraphs 6 and 7. They include persons who were keeping house (unpaid), attending an educational institution (school, university, etc.), retired, voluntarily inactive, permanently unable to work,

inmates of institutions (hospitals, gaols, sanatoria, etc.), trainee teachers, members of contemplative religious orders, and persons whose only activity during the survey week was jury service or unpaid voluntary work for a charitable organisation.

MARITAL STATUS

16. In the labour force survey, persons are classified as married or not married. The former category includes persons who are separated, while the latter category includes persons who, at the time of the survey, had never married, or were widowed, or divorced. However, the marital status to which a person is assigned depends upon the information given by the respondent, and does not necessarily reflect legal status. Before October 1982, respondents who stated that they were living in a de facto arrangement were asked how they would describe their marital status. From October 1982 such respondents were coded as married. This has resulted in some discontinuity between September and October 1982 in series classified according to marital status.

CLASSIFICATION OF INDUSTRY AND OCCUPATION

17. Industry is classified according to the Australian Standard Industrial Classification (ASIC) 1978 (1201.0 and 1202.0) and occupation according to the Classification and Classified List of Occupations, Revised June 1976.

POPULATION BENCHMARKS

18. The population survey estimates are calculated in such a way as to conform to the independently estimated distribution of the population aged 15 and over by age and sex. These independent estimates (benchmarks) are necessarily derived from incomplete information about population changes (deaths, internal and overseas migration) and can differ from estimates of the population subsequently published by the ABS. For estimates of the population and other demographic statistics reference should be made to Australian Demographic Statistics Quarterly (3101.0).

REVISION OF SERIES

19. The survey estimates for February 1978 and subsequent months are based on population estimates derived from the 1976 Population Census, adjusted for under-enumeration, and were obtained by using a new sample and revised questionnaire. Estimates from August 1966, revised to the new

basis, were published in The Labour Force, Australia, 1978 (6204.0). South Australian estimates from August 1971, revised to the new basis, were published in The Labour Force, February 1979 (6201.4).

COMPARABILITY OF SERIES

20. When comparing labour force estimates for February 1978 and subsequent months with those for earlier periods it should be noted that with the introduction of monthly surveys the interviews are now conducted during a two-week period, whereas formerly the period was four weeks. The change of timing may affect the level of the figures for any month, but particularly for months during which the employment status of the population may be changing rapidly.

SURVEY SAMPLE

21. The population survey sample was reselected after the 1971 and 1976 Censuses of Population and Housing to allow data from the latest Census to be used to improve the efficiency of the population survey sample design. The reselection following the 1981 Census has been completed, and a new sample in all States and Territories was introduced for the October 1982 survey. While estimates from two different samples may differ purely due to chance, the old (i.e. pre-October) and new samples are based on almost identical methods of stratification and selection, and there is only a small probability that the published October estimates differ significantly from the estimates that would have been produced if the old sample had been retained.

22. For information on sample design and selection see the Technical Note in The Labour Force, Australia, 1978 (6204.0).

23. Because of the introduction of the new sample of dwellings in October 1982 (see paragraph 21), there was not the usually high proportion of dwellings common to each of two consecutive surveys and the standard errors of movements between September and October 1982 are therefore higher than normal.

RELIABILITY OF THE ESTIMATES

24. Estimates in this publication are subject to two sources of error:

- (a) sampling error: since the estimates are based on information obtained from occupants of a sample of dwellings they, and

the movements derived from them may differ from the figures that would have been produced if all dwellings had been included in the survey. For more information on this topic see the Technical Notes, pages 19-20.

- (b) non-sampling error: inaccuracies may occur because of imperfections in reporting by respondents and interviewers and errors made in the coding and processing of data. These inaccuracies may occur in any enumeration, whether it be a full count or a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.

DIFFERENCES BETWEEN POPULATION CENSUS AND POPULATION SURVEY ESTIMATES

25. The results of the 1976 Population Census show that labour force figures derived from the census differ from estimates derived from the population surveys of May and August 1976.

26. The labour force definition used in the population census is similar to that used in the survey: see paragraphs 5 to 14. However, evidence from census post-enumeration surveys indicates that the personal interview approach, as used in the population survey, tends to identify a larger number of persons as being in the labour force than does the filling in of the questions on the census schedule by the householder. In addition, the post-enumeration survey following the 1976 Population Census showed an under-enumeration of the population of 1.35 per cent for South Australia. It has not been possible to adjust the published census labour force figures for any under-enumeration.

RELATED PUBLICATIONS

27. Other ABS publications which may be of interest include:

Unemployment, Australia (Preliminary Estimates) (6201.0) - issued monthly

The Labour Force, Australia (Preliminary) (6202.0) - issued monthly

The Labour Force, Australia (6203.0) - issued monthly

The Labour Force, Australia, 1981 (6204.0)

Information Paper: Questionnaires used in the Labour Force Survey, December 1981 (6232.0)

Information Paper: Review of ABS Employment Statistics (6239.0)

28. Current publications produced by the ABS are listed in the Catalogue of Publications, Australia (1101.0). The ABS also issues, on Tuesdays and Fridays, a Publications Advice (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.

SYMBOLS AND OTHER USAGES

n.e.c. not elsewhere classified

* subject to sampling variability too high for most practical uses. See paragraph 4 of the Technical Notes, page 20.

29. Figures have been rounded and discrepancies may occur between sums of the component items and totals.

TABLE B - STANDARD ERRORS OF ESTIMATES OF MONTHLY MOVEMENTS, SOUTH AUSTRALIA

For more information on sample design, estimation procedure and reliability of the estimates, for current and earlier surveys, reference should be made to the Technical Notes in The Labour Force, Australia, 1978 (6204.0) and The Labour Force, Australia (6203.0).

ESTIMATION PROCEDURE

2. The labour force estimates are derived from the population survey by use of a complex ratio estimation procedure, which ensures that the survey estimates conform to an independently estimated distribution of the population by age and sex, rather than to the age and sex distribution within the sample itself.

RELIABILITY OF THE ESTIMATES

3. Standard errors of estimates of levels and of monthly movements are shown in the tables below. The standard error of the movement is read against the size of the larger of the two estimates, appearing in the first column of Table B, from which the movement is derived. The standard errors of quarterly movements, spanning September/October 1982, and of all annual movements, are the same as those shown in the second column. Standard errors on quarterly movements not spanning September/October 1982 are those shown in the third column multiplied by 1.4. (See paragraph 23 of the Explanatory Notes).

TABLE A - STANDARD ERRORS OF ESTIMATES OF LEVELS, SOUTH AUSTRALIA

Size of estimate persons	Standard error persons	Relative standard error per cent of estimate
2,500	510	20.4
3,000	550	18.3
3,500	590	16.9
4,000	620	15.5
4,500	650	14.4
5,000	680	13.6
6,000	730	12.2
10,000	900	9.0
20,000	1,200	6.0
50,000	1,600	3.2
100,000	2,100	2.1
200,000	2,600	1.3
300,000	2,900	1.0
500,000	3,300	0.7
600,000	3,500	0.6

TABLE B - STANDARD ERRORS OF ESTIMATES OF MONTHLY MOVEMENTS, SOUTH AUSTRALIA

Size of larger estimate persons	Standard error	
	September/ October 1982 persons	Other months persons
2,500	720	490
3,000	780	520
3,500	830	540
4,000	880	570
4,500	920	590
5,000	960	610
6,000	1,000	650
10,000	1,300	760
20,000	1,700	930
50,000	2,300	1,200
100,000	2,900	1,400
200,000	3,600	1,700
300,000	4,100	1,900
500,000	4,700	2,100
600,000	4,900	2,200

4. As the standard errors in Table A show, the smaller the estimate the higher is the relative standard error. Very small estimates are subject to such high relative standard errors as to detract seriously from their value for most reasonable uses. Estimates below 2,500, and percentages based on such estimates, have not been included in this publication. Although figures for these small components can in some cases be derived by subtraction, they should not be regarded as reliable. See paragraphs 6 and 7 concerning higher cut-off points for some estimates.

5. Examples of the calculations and use of standard errors are given below:

- (i) From Table A it will be seen that the estimate of 350,500 employed males in November 1982 has a standard error of about 3,000, and therefore there are about two chances in three that the value that would have been produced if all dwellings had been included in the survey will fall within the range 347,500 to 353,500 and about nineteen chances in twenty that the value will fall within the range 344,500 to 356,500.
- (ii) The estimate of movement in the number of employed males from October to November 1982 is -4,000. Table B relates the standard error of the monthly movement to the larger of the two estimates from which the movement is derived. In this case the October 1982 estimate (354,500) is the larger. From Table B it will be seen that the standard error of the monthly movement is about 2,000. Therefore there are about two chances in three that if all dwellings had been included in the survey the movement would have been within the range -6,000 to -2,000 and about nineteen chances in twenty that it would have been within the range -8,000 to nil.

6. The relative standard errors of estimates of average hours worked and average duration of unemployment are obtained by first finding the relative standard error of the estimate of the total number of persons contributing to the estimate (see Table A) and then multiplying the figure so obtained by the following relevant factors:

average hours worked : 0.5

average duration of unemployment : 1.5

7. Because of these higher relative standard errors, estimates of average duration of unemployment have higher cut-off points for publication than other estimates as shown in Table A.

8. It must be remembered that there is no justification for saying that the 'true' estimate is more likely to be at any one point in the range than at any other.

LABOUR FORCE, SOUTH AUSTRALIA

FEBRUARY, 1993

NOTES

For more information about these statistics, including requests for copies of publications, telephone the Information Officer on Adelaide (08) 226 5433 or call 1800 485 600, ground floor, Adelaide City Office Centre (10 Pirrama Street), or write to Information Services, 901, GPO, GPO Box 2232, Adelaide S.A. 5001.

4. As the standard errors in Table B show, the smaller the estimate, the greater the relative standard errors. Very small estimates are subject to such high relative errors that it is difficult seriously to use their values for most reasonable uses. Furthermore, percentages based on such estimates, have not been included in this publication. The figures for these small components can in some cases be derived by extrapolation, but should be regarded as reliable. See paragraphs 5 and 7 concerning higher cut-off points for small estimates.

5. Explanation of the calculations and use of Table B.

(i) From Table A it will be seen that the monthly movement in the number of employed males in 1962 had a standard error of 150,000. In terms of the value that was estimated, this means that the value that was included in the survey will fall within 150,000 of the true value. There is a 95 per cent chance in twenty that the value will fall within the range 150,000 to 150,000.

(ii) The estimate of movement in the number of employed males from October 1961 to October 1962 is -4,000. Table B relates the standard error of the monthly movement to the larger of the two estimates from which the movement is derived. In this case the October 1962 estimate (354,500) is the larger. From Table B it will be seen that the standard error of the monthly movement is about 2,000. Therefore there is a 95 per cent chance in three that if all dwellings had been included in the survey, the movement would have been within the range -8,000 to -2,000 and about 90 per cent chance in twenty that it would have been within the range -8,000 to 2,000.

6. The relative standard errors of estimates of average hours worked and average duration of unemployment are obtained by first finding the relative standard error of the estimate of the total number of persons contributing to the estimate (from Table A) and then multiplying the figure so obtained by the following relevant factors:

average hours worked : 0.5
average duration of unemployment : 1.5

7. Because of these higher relative standard errors, estimates of average hours worked and average duration of unemployment have higher cut-off points for publication than other estimates in this publication.

8. It must be remembered that there is no justification for saying that the value of the estimate is more likely to be at any one point in the range than at any other.
